

SHOW GUIDE

Bystronic Glass

Bystronic Glass customers will get an overview about the latest machinery for the manufacturing of insulating glass and laminated glass, handling equipment and for the pre-processing of automotive glass at the FIT Show.

To underline the cooperation with Hegla, both partners present itself at one joint stand. Consequently, customers will be able to conduct joint talks comfortably with experts from both companies.

Bystronic Glass offers a line or machine to meet the requirements of all glass manufacturers, it claims. The first line is an individually configurable insulating glass production line

for all established spacers. Use it with the flexspacer applicator for IG units with SuperSpacer, use it with the tps applicator for IG units with Thermo Plastic Spacer (TPS) or simply use it with the spacerbenderCombi for IG units with aluminium.

Bystronic Glass also customises the machinery for the manufacture of laminated glass and individually configures them to meet the customer's needs. One example is the eco lamiline which enables all versions of laminated glass to be produced in an energy-efficient manner.

Other glass solutions will be available at the stand.
